

Good Day; This proposal would allow broadband fields to be almost everywhere. ie. what exposure is safe when you are under an electric blanket and have no distance to these broad frequency fields? We are all inside structures with AC power lines all around us. The potential long term physical effects are unknown. The potential interference to other licensed services is very high in my opinion. The ability of utility companies who are short staffed now, and not doing the preventative maintainance they once did to handle the issues that are sure to happen, is very questionable. I am an Amateur Radio Operator, and also a FEMA and MARS license who uses the HF frequencies for my hobby as well as for Public Service and I am also concerned about the very large potential from this proposal of causing interference that may greatly limit my ability to provide communications when needed for the public good. Regards; Ken Koyan
